Major Airborne EM Survey Commences

- Detailed modern HeliTEM2 **airborne electromagnetic (EM) survey has commenced** over Odin's emerging, district scale, highly prospective **Koonenberry Copper and Base Metals Project**.
- The survey, **the largest of its type in the region**, will cover an area of 1,150km² (Figure 1), within Odin's 2,600km² land holding including ~150km strike of the significantly under-explored Koonenberry Belt.
- **The EM survey will focus on all known mineralised trends as well as potential new trends** within the entire northern half of Odin's Koonenberry Copper Project holding including:
 - the recently acquired Grasmere Deposit hosted within 25km's of underexplored VMS prospective tenure.
 - the Cymbric Vale prospect area where previous drilling has intersected 20m @ 0.73% Cu and 20m @0.33% Cu. This work has never been followed up.
- **The EM survey is expected to be completed early June 2021.**
- Digital compilation of all historic data in the region is also underway and will be completed prior to completion of the HeliTEM2 survey.
- Following interpretation and targeting, on the new EM data and historic data, **drilling is expected to commence in 3rd Quarter, 2021**, including drilling at the Grasmere deposit.
- *Please see Figure 1 outline of the EM survey on the next page*
